7

8 **Figure 2.** Relative blood-serum levels of piglets. Expression levels are reported as fold
9 change compared to average expression levels of uninfected (sdH₂O inoculated) control
10 groups. Graph shows means and standard error of the means. Differences were considered
11 significant at (*) $p < 0.05$, (**) $p < 0.01$ and (***) $p < 0.001$ for immune response levels of
12 placebo vs. other treatments in each analyzed blood-serums.
